DeepScan
Radiology Report

1. Preliminary
Imaging
Assessment: A
preliminary
assessment of the
imaging data for
Jane, a 45-year-
old patient,
examined on
2026-01-01,
suggests no
apparent
abnormalities.

The model's analysis is based on a comprehensive evaluation of the

Clinical Assistant Chat

Can you explain more clearly?

Assistant

I'd be happy to explain the report in a way that's easy to understand.

- Simple Explanation** The report is about the results of your imaging test, which was done to check for any abnormalities. A computer program (called a model) looked at the images and didn't find anything that seems out of the ordinary. However, the computer isn't 100% sure about its findings, so it's recommended that a human expert, a radiologist, takes a closer look.
- Meaning** The "BI-RADS 1" categorization means that the computer thinks the images look normal, but it's not completely confident in its assessment. This doesn't necessarily mean anything is wrong, it just means the computer wants a second opinion from a human expert. The confidence score of 50.18% is like a grade, and in this case, it's not high enough for the computer to be absolutely sure about its findings.
- What to Do Next** The next step is for a licensed radiologist to review the images. They will take a closer look and confirm whether everything is normal or if further testing is needed. If you have any symptoms or concerns, it's essential to discuss them with your doctor, as they may not be visible on the images.
- Reassurance** Please don't worry about the uncertainty in the report. It's a normal part of the process, and it's always better to be safe than sorry. The radiologist will review the images and

provide a final interpretation, which will give you a clearer understanding of your results. Remember, this is just a preliminary assessment, and it's not a medical diagnosis. Your healthcare team is here to support you, and we'll work together to ensure you receive an accurate diagnosis and any necessary care.
